Modern Power Distribution Systems: Operation and Management Methodologies

Editors:

Sukumar Kamalasadan, University of North Carolina at Charlotte, USA

Vijay Kumar Sood, Ontario Tech University, Canada

Krishna Murari, Indian Institute of Technology Bhilai (IIT Bhilai), India

As power systems evolve from inertia-driven, synchronous generation to converter-based renewable energy, inverter-based resources (IBRs) are reshaping the modern electrical grid. This book brings together leading experts to provide a comprehensive and timely overview of IBR-based electrical distribution systems.

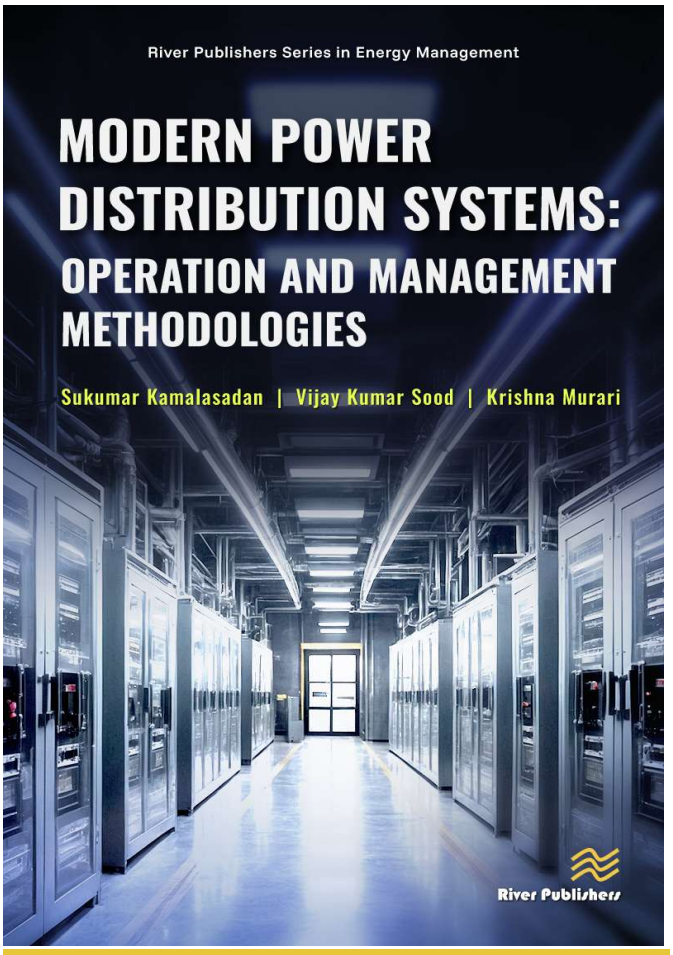
The chapters explore the rapid integration of solar, wind, and battery storage, and the critical role of power electronics and digital technologies in enabling a more sustainable and resilient grid. Key challenges—such as reduced system inertia and limited disturbance ride-through capability—are addressed alongside emerging solutions, including advanced control strategies, energy storage, and synthetic inertia through virtual synchronous generators.

Designed for both energy specialists and non-energy engineers, this book offers a clear and accessible guide to the principles and operation of next-generation distribution networks. It equips engineers, researchers, and technical managers with the knowledge needed to understand, design, and optimize modern grid systems in an era of increasing IBR penetration.

With its practical insights and forward-looking perspective, this volume is an essential resource for anyone working at the intersection of power systems, renewable energy, and smart grid technologies.

TABLE OF CONTENTS

- Introduction
- Modeling Aspects of Distribution System with Inverter-based Resources
- Power Flow Methods of an IBR Integrated Electric Distribution System
- Extension of Distribution Transformer Life for Distributed Solar Photovoltaic Systems with Smart Inverters
- Quasi Steady State Time-series Power Flow of an IBR Integrated Distribution System
- Control Approaches and Management of Inverter-based Resources
- Grid Integration Approaches of Inverter-based Resources
- Enhanced Hydrogen Production with an Mov-FsLMP-based Control Method in Hybrid EV Charging Stations and Energy Management
- Optimal Management and Control of an IBR Integrated distribution system
- Protection of an IBR Integrated Distribution System
- Conclusions and Future Work



River Publishers Series in Energy Management

ISBN: 9788743810094
e-ISBN: 9788743810117
Available From: March 2027
Price: € 129.32

KEYWORDS:
Organizational inverter-based resources (IBRs), unbalanced distribution network, optimal power flow (OPF), centralized OPF, distributed OPF, equivalent network approximation, distributed energy resources (DER), PV bus, voltage stability margin, current injection load flow, dynamics of DERs, spectral clustering, resiliency, DER, active power grouping, microgrid, high impedance faults, fault detection, AC/DC distribution systems, grid-following inverter, grid-forming inverter
